

Internship Puzzle

Imagine you are the CEO of a Commercial Real Estate Company. Your company has 10 properties in which there are 30 clients where each of them have different start and end dates of leases.

As a CEO you wish to have visibility of all client leases across these properties, look at where all vacancies are high, or leases are about to expire and focus on these high-risk properties.

With increasing number of properties managing this simple data has got complex. How would you approach this problem?
